The Beam Optics at the Extraction Region of SNS ring; Revisited

Abstract
The optics of the beam extraction section of SNS ring has been published in Ref. [1] where we show that by optimizing the aperture and locations of the extraction kickers, we can accomplish both, first the elimination of the beam losses for the circulating and extracted beam, and second the minimization of the required voltage applied to the coil of the extraction kickers which deflect the beam vertically to the correct location to clear the extraction septum[2]. Also a number of papers have been published [2,3…10] to discuss the extraction devices (Kickers and Extraction Septum) of the SNS ring. Mechanical constraints however at the location of the SNS extraction kickers required that all fourteen extraction kickers be moved downstream in the ring by five centimeters. In this Technical Note we present the new optics of the SNS extraction region. The results of the study show that the placements of all the extraction kickers by five centimeters downstream can generate the required beam extraction conditions by simply raising the voltage of some of the kickers by about 2% of their original settings.

Introduction

The beam extraction region[1] of the SNS ring is located in one of the four straight sections of the SNS ring. The beam extraction process, which is designed to extract the single circulating beam bunch in one turn, is based in kicking the beam downwards by $Y'_{\text{cod}} \sim 13.3$ mrad with the fourteen kickers, shown in Figure 1, (seven kickers are placed upstream of the two narrow quads NQ1 and NQ2 of the SNS ring and seven kickers are placed downstream of the narrow quads) into the Lambertson septum magnet which deflects the beam by $16.8^\circ$ into the RTBT line. The vertical displacement of the extracted beam at the entrance of the Extraction Septum magnet is $Y_{\text{cod}} =167.0$ mm.

A schematic diagram of the extraction kickers and the extraction septum is shown in Figure 1. In the same figure the vertical displacement of the central orbit ($Y_{\text{cod}}$) resulted from exciting all fourteen kickers is also shown.

The location and inductance of each of the kickers was optimized to minimize the required voltage applied on each kicker to extract the beam into the septum magnet. The aperture of each kicker was also optimized to eliminate the beam losses of the circulating beam and the extracted beam. Mechanical constraints at the location of the extraction region, required that each of the kicker assemblies is moved downstream by five centimeters from their previously chosen optimum location. In the next section of this technical note we discuss the beam optics of the extracted beam under the new placement of the extraction kickers, and we compare the required voltages applied on the kickers before and after the kicker displacement, under the condition of lossless beam extraction.
**Figure 1.** Schematic diagram showing the location of the extraction kickers relative to the narrow quads (NQ1,NQ2) of the SNS straight section. The last element is the septum magnet. The same figure also shows the plot of the vertical displacement of the central orbit ($Y_{cod}$) when all fourteen kickers fire. The beam displacement is below the median plane of the ring.

**Beam Optics of the Extraction Region**

The single beam bunch circulating in the SNS ring is extracted in one turn, upon firing all fourteen extraction kickers. Subsequently the beam bunch is deflected downwards into the main field region of the Lambertson septum magnet which deflected the beam horizontally by 16.8° into the RTBT beam transfer line. An optimized beam extraction system requires that the kickers have large enough acceptance to accommodate the $480\pi[\text{mm.mrad}]$ emittance of the circulating beam and the $400\pi[\text{mm.mrad}]$ of the extracted beam. The beam size at the location of each kicker is determined from the beam emittance and the $\beta_{x,y}$ functions at the location of the kickers. In addition the vertical aperture of the kicker should allow for the vertical
displacement of the beam during extraction. The rise time of the voltage of each kicker should be ~90 nsec therefore the rise time of the Voltage of each kicker which depends on the inductance of the kicker sets an upper limit in the geometrical length of the kicker. The characteristics of each kicker, that depend on the beam optics are tabulated in Table I. A description of the columns that appear in Table I follows:

<table>
<thead>
<tr>
<th>Column#</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Name of the Kicker</td>
</tr>
<tr>
<td>2</td>
<td>Distance of the center of the Kicker from the center of the quadrupole Q1</td>
</tr>
<tr>
<td></td>
<td>(see Fig. 1) The quadrupole Q1 is the first quadrupole of the straight section.</td>
</tr>
<tr>
<td>3</td>
<td>The maximum value of $\beta_x$ over the length of the kicker.</td>
</tr>
<tr>
<td>4</td>
<td>The maximum value of $\beta_y$ over the length of the kicker.</td>
</tr>
<tr>
<td>5</td>
<td>The maximum horizontal beam_size of the circulating beam over the length of the kicker. Horizontal Emittance of the circulating beam $\varepsilon_x=480\pi [\text{mm.mrad}]$ $x_{\text{size}}(480\pi) =2(\varepsilon_x\beta_x)^{1/2}$</td>
</tr>
<tr>
<td>6</td>
<td>The maximum vertical beam_size of the circulating beam over the length of the kicker. Vertical Emittance of the circulating beam $\varepsilon_y=480\pi [\text{mm.mrad}]$ $y_{\text{size}}(480\pi) =2(\varepsilon_y\beta_y)^{1/2}$</td>
</tr>
<tr>
<td>7</td>
<td>The maximum vertical half_beam_size of the extracted beam over the length of the kicker. Vertical Emittance of the extracted beam $\varepsilon_y=400\pi [\text{mm.mrad}]$ $y_{\text{size}}(400\pi) =2(\varepsilon_y\beta_y)^{1/2}$</td>
</tr>
<tr>
<td>8</td>
<td>The vertical displacement of the central orbit ($Y_{\text{cod}}$) of the extracted beam. The value of $Y_{\text{cod}}$ is obtained from the output of the MAD_model of the extraction section (See APPENDIX 1)</td>
</tr>
<tr>
<td>9</td>
<td>The vertical aperture of the kicker calculated from: $V_{\text{size}}={y_{\text{size}}(480\pi)+y_{\text{size}}(400\pi)}/2 + Y_{\text{cod}}$</td>
</tr>
<tr>
<td>10</td>
<td>The Horizontal aperture of the kicker. $H_{\text{size}}=x_{\text{size}}(480\pi)$</td>
</tr>
<tr>
<td>11</td>
<td>The Maximum vertical aperture of the kicker. It is determined by the Max{$V_{\text{size}}$(column #9), $y_{\text{size}}(480\pi)$}</td>
</tr>
<tr>
<td>12</td>
<td>The Final Horizontal aperture of the spare kickers. Six sets of spare kickers were selected. The sets of the spare kickers can satisfy the beam constraints at extraction for all “working points” selected. The four working points are: $(Q_x, Q_y) = (6.23,6.20), (6.23,5.24), (6.30,5.8), (6.40,6.30)$</td>
</tr>
<tr>
<td>13</td>
<td>Same as column 12 but for the Vertical aperture of the actual kickers</td>
</tr>
<tr>
<td>14</td>
<td>The length of the actual kickers.</td>
</tr>
<tr>
<td>15</td>
<td>The vertical distance of the inner_top_aperture of the kicker from the center line of the ring.</td>
</tr>
</tbody>
</table>

The results tabulated in Table 1 show that the acceptance of the extraction region does not limit either the circulating or extracted beam.
Parameters of the Kickers

The extraction kickers, when energized, kick in a one turn, the single beam bunch circulating in the SNS ring, vertically down into the main field region of the septum magnet which deflects the beam by 16.8° to the left to the RTBT beam transfer line. Each extraction kicker has to satisfy the following constraints:

1. The acceptance of the kicker should allow for zero beam losses for both the circulating and extracted beam.
2. The voltage rise time should be ~90 nsec
3. An upper limit for the kicker voltage is set to 35 kVolts.

The content of the columns of Table 2 is explained below.

<table>
<thead>
<tr>
<th>Column#</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Name of the kicker</td>
</tr>
<tr>
<td>2</td>
<td>Kick of the kicker</td>
</tr>
<tr>
<td>3</td>
<td>Physical length of the kicker</td>
</tr>
<tr>
<td>4</td>
<td>Horizontal aperture of the kicker</td>
</tr>
<tr>
<td>5</td>
<td>Vertical aperture of the kicker</td>
</tr>
<tr>
<td>6</td>
<td>The integrated dipole field of the kicker (∫Bydz) given as the product of the value of the kicker’s kick in radians and the beam rigidity of 1 GeV protons .</td>
</tr>
<tr>
<td>7</td>
<td>The approximate strength of the dipole field of the kicker calculated as: (∫By·dz)/(Length_of_Kicker)</td>
</tr>
<tr>
<td>8</td>
<td>The current of the kicker’s coil required to produce the dipole magnetic field.</td>
</tr>
<tr>
<td>9</td>
<td>The voltage of the kicker required to produce the required current.</td>
</tr>

<td>The Inductance of the kicker as calculated from the geometrical parameters of the kicker.</td>
</tr>
</tbody>
</table>

Conclusions

The displacement of each the fourteen beam extraction kickers of the SNS ring, by 5 cm downstream, can satisfy the same beam extraction condition as the non_displaced kickers by adjusting the voltage of the kickers as follows:

<table>
